Interaction of conduction electrons

$$\begin{aligned} \tilde{\epsilon}_h u_h v_h &= -\frac{1}{2N} (u_h^2 - v_h^2) \sum_{h'} J^2 u_{h'} v_{h'} \times \\ &\quad \times [\omega_{h-h'+h+x} + \epsilon_{h+x}, (u_h^2 - \epsilon_h v_h^2 + \epsilon_{h+x}, (u_{h'}^2 - \epsilon_{h'} v_{h'}^2)^{-1}], \end{aligned} \quad (14-15)$$

FD-31462

$$2\tilde{\epsilon}_h = \epsilon_{h\downarrow} + \epsilon_{h+x,\uparrow} - \frac{1}{N} \sum_{h'} J^2 (u_{h'}^2 - v_{h'}^2) \times$$

$$\times [\omega_{h-h'+h+x} + \epsilon_{h+x}, (u_h^2 - \epsilon_h v_h^2 + \epsilon_{h+x}, (u_{h'}^2 - \epsilon_{h'} v_{h'}^2)^{-1}]$$

After some transformations,

$$\tilde{\epsilon}_h u_h v_h = -\frac{1}{2} (u_h^2 - v_h^2) c_h, \quad (17)$$

with

$$c_h = \frac{1}{N} \sum_{h'} J^2 u_{h'} v_{h'} [\omega_{h-h'+h+x} + \tilde{\epsilon}_h + \tilde{\epsilon}_{h'}]^{-1}. \quad (18)$$

results. Proof is given that (18) has only the trivial solution $c_h = 0$ which is obtained in the normal state. It is thus shown that the interaction of conduction electrons with spin waves in a ferromagnetic material has a repulsive character and cannot give rise to a superconductive state. This result is, in addition, derived from the equality of expressions for the exchange interaction with (a) longitudinal phonons and (b) spin waves.

TITLE: On superconductivity in non-uniform ferromagnetics

PERIODICAL: Fizika metallov i metallovedeniye, v.15, no.2, 1963,
3.6-318

TEXT: The theory on the existence of superconductivity in ferromagnetics is discussed together with some related questions. A fully penetrated field is not specially stipulated and either assumptions remain as in BCS (J.N.Cooper, Phys. rev. et al., v.7, 1962, 367). It is shown that superconductivity can only occur in ferromagnetics when

$$p < \epsilon_{0,bcs} \sqrt{\frac{1}{2} + \frac{3Ne_F}{2a(p)}} \quad (8)$$

where $p = \frac{1}{2} \mu I$, I - energy parameter for s-d or s-f exchange,

$\mu = \frac{1}{N_1} \sum s_1^2$, $\epsilon_{0,bcs}$ - the gap in the energy spectrum of a super-

Card 1/2

E039/E435

conductor, ϵ_F - the Fermi sphere parameter. From Eq.(8) it is evident that the superconducting condition in ferromagnetics is possible only for sufficiently weak s-d or s-f exchanges. It is concluded that the proposals in Ref.(1) on the type of electron pairing lead not only to an explanation of the "Knight" displacement but also to a positive solution of the question of the existence of superconductivity in ferromagnetics and to the possibility of the existence of superconductivity in the case of new types of exchange if sufficiently weak s-d or s-f exchanges.

TITLE: On superconductivity in nonuniform paramagnetics and
high critical field alloys

PERIODICAL: Fizika metallov i metallovedeniye, v.15, no. 1,
318-320

TEXT: Recent attempts to develop a phenomenological explanation
of the high value of the critical magnetic fields for certain
alloys are discussed. The work of L.N.Cooper (Phys.Rev.Lett.,
v.8, 1952, 367) is considered in particular. Cooper does not
show that the energy of superconducting paramagnetics is lower
than the energy of normal paramagnetics. It is evident that only
in this case is it possible to realize a superconducting para-
magnetic and hence it is necessary to examine the conditions under
which its energy is lower than for both the energy of the non-
paramagnetic superconductor and the energy of the normal para-
magnetic. Expressions for these conditions are derived and it
is shown that

$$H < \frac{\epsilon_0 b_{cs}}{\mu} \sqrt{\frac{1}{2} + \frac{3}{2} \frac{N_{EF}}{a(H)}} \quad (5)$$

Card 1/2

S/126/63/015/002/033/033

TITLE: Theory of s-f exchange for nonvanishing orbital angular momentum

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 49, no. 2, 1965,
682-690

TOPIC TAGS: exchange reaction, rare earth element, nuclear shell model, quantum number, superconductivity

ABSTRACT: The authors analyze s-f exchange interaction in the case when the total angular momentum J of the f-shell is a good quantum number. The approach used differs from that employed in an earlier paper (ZhETF v. 37, 1354, 1964), where the quantum number J was assumed conserved. The Hamiltonian for s-f exchange connected with changes in J is established and its effects on indirect exchange interaction and on superconductivity are assessed. This Hamiltonian, together with the indirect-exchange Hamiltonian and the conduction-electron interaction Hamiltonian, which are derived on its basis, makes it possible to investigate the distinguishing features of processes accompanied by excitation of the total angular momentum of rare-earth ions. It is shown that excitations of J cannot lead to ferromagnetic ordering of different rare-earth ions, but can influence the occurrence of

ACCESSION NR: AP502.L134

6

ordered states other than ferromagnetic, characterized by superpositions of states with different J. In addition, these excitations of J can contribute to the proper energy of the rare-earth ions. The special behavior effect of Eu impurities on the lowering of the critical superconductivity temperature is explained. The results obtained by R. Brout and H. Suhl (Phys. Rev. Lett. v. 2, 387, 1959) and by C. Herring (Physica v. 24, 5184, 1958) are reviewed critically. Orig. art. has: 23 formulas and 1 table.

TITLE: Unidirectional anisotropy [Report, Symposium on Ferromagnetism and Ferroelectricity held in Leningrad 30 May to 5 June 1962]

SOURCE: AN SSSR. Izvestiya fizicheskaya, v.28, no.3, 1964, 423-429

TOPIC TAGS: ferromagnetism, antiferromagnetism, cubic lattice ferromagnets, unidirectional anisotropy, nickel manganese alloy

ABSTRACT: A substance is said to possess unidirectional anisotropy (UA) when its magnetic properties differ in the two directions of the same crystallographic axis. This phenomenon was first observed by W.H. Meiklejohn and C.P. Bean (Phys. Rev., 105, 904, 1956), who ascribed its appearance in their material to an exchange interaction across the boundaries between ferromagnetic and antiferromagnetic phases. Two of the present authors have suggested that UA could appear in a single ferromagnetic substance provided a weakly interacting sub-lattice constituting an antiferromagnetic subsystem were present, and they have given a thermodynamic discussion of a unidirectional subsystem.

Card 1/3

ACCESSION NR: AP4023383

axial system of this sort (K.B.Vlasov and A.I.Mitsek, Fizika metallov i metallovedeniye, 14, 487, 498, 1962). In the present paper the theoretical treatment is extended to systems with cubic symmetry. UA is possible when the coupling between the anti-ferromagnetic vector and the crystal lattice is stronger than the coupling between the ferromagnetic and antiferromagnetic subsystems. The states with UA are metastable and can be altered by application of a magnetic field exceeding the threshold field of the antiferromagnetic subsystem. UA was observed in disordered Ni-Mn alloys (28.1 atomic percent Mn) at temperatures below 20.4°K. The magnetization was investigated in the [111] direction, and the UA was evinced by a characteristic bend in the magnetization curve or by a horizontal shift of the hysteresis loop. Samples that were cooled in the presence of a magnetic field showed UA; those that were cooled in the zero field did not. The samples were subjected to an intense pulsed magnetic field (up to 170 kOe) in an effort to alter their UA. At 4.2°K a field of 10 kOe appreciably altered the UA of a sample that had been cooled in a field of 1300 Oe, and a field of 130 kOe changed its sign. A sample that was cooled in the absence of a magnetic field and initially showed no UA, acquired UA when subjected to magnetic fields greater than 60 kOe. The degree of UA (as measured by the shift of the hysteresis loop) was a linear function of the field for inducing fields greater than 60 kOe. These fields are of the order of the threshold fields for typi-

Card 2/3

ACCESSION NR: AP4023383

cal cubic antiferromagnetics. The experimental results thus support the hypothesis that the investigated alloys possess both ferromagnetic and anti-ferromagnetic states. Orig. art. has 14 formulas and 3 figures.

TITLE: Superconductivity of an electron system with singlet or triplet pairs

SOURCE: Zh. eksper. i teor. fiz., v. 46, no. 5, 1964, 1619-1631

TOPIC TAGS: superconductivity, conduction electron, phonon, Coulomb field, ferromagnetism, antiferromagnetism, paramagnetism, exchange force

ABSTRACT: The influence of the type of symmetry of the coordinate part of the wave function of the electron (cooper) pair on the establishment of the superconducting state was investigated in view of the importance of the question of the realization of the superconducting state with singlet or triplet (Cooper) pairs of conduction electrons to problems involving the coexistence of superconductivity

Card 1/4

ACCESSION NR: AP4037574

with magnetic properties and other questions. It is shown that the type of symmetry of the coordinate part of the wave function of the electron pair manifests itself first of all in the appearance of an "exchange" part of the matrix element, characterizing the transitions of these pairs and having different signs in the singlet and in the triplet states. The exchange parts of the matrix elements characterizing the interaction of the conduction electrons, induced by phonons, Coulomb forces, and also spin waves of a ferromagnet or an antiferromagnet, are determined. The effect of the exchange part of the interaction on the establishment of the superconducting state with singlet or triplet pairs is discussed. In addition, trial wave functions of a superconductor with triplet or triplet pairs corresponding to the Bardeen, Cooper, and Schrieffer method (Phys. Rev. v. 108, 1175, 1957) are constructed and the corresponding variational problem is solved. The manifestations which make it possible to include the triplet pairs in the Bogolyubov method (N. N. Bogolyubov, V. V. Tolmachev, D. V. Shirkov, *Novyj metod v teorii superprovodimosti*)

Card 2/4

ACCESSION NR: AP4037574

mosti, 1958) and in the method of two-time temperature Green's functions (D. N. Zubarev, UFN v. 71, 71, 1960), are also indicated. It is shown that the presence of the "exchange" part of the matrix element, determining the transitions of the singlet or triplet pairs, is indeed a general property of all the interactions considered above (induced by virtual photons, Coulomb forces, or virtual waves of a ferromagnet or antiferromagnet). In the vicinity of the Fermi surface the character of the interaction described by the exchange part corresponding to the triplet states experiences an abrupt transition from attraction to repulsion for the interaction induced by the phonons and conversely from repulsion to attraction for interactions induced by Coulomb forces or spin waves). The latter can explain the coexistence of superconductivity with ferromagnetism or antiferromagnetism, or else paramagnetism. Orig..art. has: 60 formulas.

TITLE: Effect of conduction electron exchange on ferromagnetic spin ordering in metals

SOURCE: Fizika metallov i metallovedeniye, v. 17, no. 2, 1964, 168-175

TOPIC TAGS: conduction electron exchange, electron polarization, ferromagnetic spin ordering, Hamiltonian, Fermi operator, Green's function, spin-ordered state

ABSTRACT: The effect of conduction electron exchange on electron polarization (satisfied by s-d or s-f exchanges) and on ferromagnetic spin ordering of electrons in the incomplete electronic shells of metallic atoms has been studied analytically. The Hamiltonian of the d and f electrons is written in terms of Fermi operators, and its solution is carried out by introducing the two-dimensional Green's function, limiting it to a first approximation. The energy of the system thus is represented by

$$\langle H \rangle = E_0 - I_0 - \frac{3n}{16\epsilon_0} \frac{J^2}{(1-s)} (\langle n_{s+} \rangle - \langle n_{s-} \rangle)^2 - \frac{1}{2} J n_s n_{s+}$$

where $n_s = \sum \langle n_{s\sigma} \rangle$. $E_0 = \frac{3}{5} n I_0$ and $I_0 = 4\pi e^2 \left(\frac{3n}{8\pi}\right)^{4/3}$

Card 1/2

ACCESSION NR: AP4017348

The kinetic and transfer energy of the conduction electrons at $n_s = n_f = n/2$ and the two terms on the right hand side of the above expression account for the effect s-d or s-f of the (J) exchange. The third term shows that the spin-ordered state of interior shells appears in a more favorable energy state than in the absence of such ordering. This mechanism of indirect exchange thus appears to be $(1 - \alpha)^{-1}$ times more effective when including the conduction electron exchange term. For Gd the coefficient $(1 - \alpha)^{-1}$ yields a value of 1.75. Orig. art. has: 40 equations.

ABSTRACT: The problem of the existence of ferromagnetism and superconductivity is of interest in view of the fact that investigation thereof can yield information of the physical nature of ferromagnetism and superconductivity in metals and thereby serve for further elaboration of the pertinent parts of solid state theory. This problem is intimately bound in with the question of the influence exerted on interaction of conduction electrons by shift of the Fermi momentum surfaces for electrons with different spin components and by exchange of virtual spin waves. The latter factor also obtains in antiferromagnets; hence discussion of it is of added

1/3
Card

ACCESSION NR: AP4023382

interest. There appears to be unanimity of opinion among investigators regarding the role played by the first factor, which was first mentioned in 1958 by the present authors (Doklady AN SSSR, 122, 204, 1958). The second factor is generally agreed to give rise to repulsion of electron pairs in the singlet state and thus hamper or inhibit superconductivity. However, other students report (A. I. Akhiezer and A. I. Ya. Pomeranchuk, Zh. eksp. i teor. fiz., 36, 859, 1959 and A. I. Akhiezer and I. A. Akhiezer, Ibid., 43, 2208, 1962) that in the triplet state (zero projection of the pair spin) a change occurs in the sign of the matrix elements defining the electron interaction so that an additional attraction favoring establishment of superconductivity appears. Hence it was deemed desirable to consider the question of Cooper pairs in singlet and triplet states in more detail in the framework of the Bardeen-Cooper-Schrieffer-Bogolyubov theory. The question is analyzed in the present paper. Equations are written for the interaction Hamiltonian with operators to distinguish between the singlet and triplet states. Some of the results of the analysis are the following: In a nonhomogeneous ferromagnet superconductivity and ferromagnetism can exist in the case of sufficiently weak sd and sf interaction. The shift of the Fermi momentum surfaces decreases by

Card 2/3

ACCESSION NR: AP4023382

a significant factor as compared with the $2p$ value obtaining in the normal state. Persistence of the reduced shift permits realization of ferromagnetism due to superexchange interaction. In addition, an inequality is derived to evaluate the upper bound of the field H for which there may exist both superconductivity and paramagnetism. This inequality is a generalization of A. M. Clogston's criterion. (Phys. Rev. Letters, 8, 367, 1962). Orig. art. has: 21 formulas.

TITLE: Contribution to the theory of sd-exchange interaction in transition metals
Report, Symposium on Ferromagnetism and Ferroelectricity held in Leningrad 30 May
to 5 June 1963

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v.28, no.3, 1964, 406-411

TOPIC TAGS: electron interaction, sd-exchange interaction, indirect exchange interaction,
superexchange interaction, transition metal magnetic moment, transition metal form factor,
dilute alloy ferromagnetism, rare earth helicoid structure

ABSTRACT: A unified treatment is given of the following three problems involving
interaction between localized and collectivized electrons in transition metals: in-
direct exchange interaction via the conduction electrons; the magnetic form factor
of a transition metal ion; the effective magnetic moment of a transition metal ion.
The Dirac operator for the sd-exchange interaction between the conduction and the
bound electrons is expressed in the second quantization representation. The indir-
ect exchange interaction is to be obtained from this by eliminating the creation
and

Card 1/3

ACCESSION NR: AP4023381

and destruction operators $a_{\mathbf{k}s}^+$ and $a_{\mathbf{k}s}$ for the conduction electrons. This is accomplished approximately by averaging over the grand canonical ensemble. The indirect exchange interaction and the electron spin density are thus expressed in terms of the same correlator $\langle a_{\mathbf{k}'s}^+ a_{\mathbf{k}''s} \rangle$, where the brackets indicate the average over the canonical ensemble. The correlator is evaluated by the two dimensional Green's function method of N.N.Bogolyubov and S.V.Tyablikov (Dokl.AN SSSR,126,53,1959). The integro-differential equation for the two dimensional Green's function is solved by iteration, and a perturbation series is obtained for the correlator. To evaluate the indirect exchange integral, it is assumed (for lack of information to the contrary) that the sd-exchange integral is independent of the momentum transfer. The indirect exchange integral is evaluated in closed form for the case that the conduction band is either thinly or densely populated, so that the free quasiparticle approximation can be employed for electrons or holes. The indirect exchange integral in this case is long range (inverse cube) and oscillatory. Indirect exchange of this type is responsible for ferromagnetism in dilute alloys and for the formation of helicoid structure in rare earth metals. If the conduction band is roughly half filled, the character of the indirect exchange interaction is entirely different, but no general conclusions can be drawn concerning it. The electron spin density about a transi-

2/3
Card

ACCESSION NR: AP4023381

tion metal ion, and hence the magnetic form factor and effective spin of the ion, are determined by the same correlator that determines the indirect exchange interaction. Expressions are derived for the effective form factor and spin. With the aid of these formulas, conclusions can be drawn concerning the indirect exchange interaction from measurements of the form factor or the magnetic moment of transition metal ions. TOPIC TAGS: rare earth metal, electron interaction, exchange interaction, magnetic property, superconductivity, phase transition, mathematical physics

ABSTRACT: The authors employ the formalism of second quantization to discuss the exchange interaction between conduction electrons and the electrons in the f shells of the ions of a rare earth metal lattice, and the exchange interaction between the f electrons to which it gives rise. Additional terms to the s-f exchange Hamiltonian of S.N.Liu (Phys. Rev., 121, 451, (1961)) are obtained, which contain operators that change the total angular momentum J of the f-shell electrons by one unit, and the effects of the new terms on magnetic ordering, superconductivity, and phase transitions are discussed. The $J_n J_m$ terms in the f-f exchange Hamiltonian obtained in the second order

" Card 1/2

L 07105-67

ACC NR: AP6029097

of perturbation theory are independent of energy, the s-f exchange associated with change of J , therefore, cannot lead to long range magnetic order. The new terms in the s-f exchange Hamiltonian lead to interactions between singlet and triplet pairs of conduction electrons. The interaction between singlet pairs is repulsive and results in a reduction of the transition temperature to the superconducting state. The reduction of the transition temperature of La by admixtures of Eu is quantitatively (within 20%) accounted for. The addition of other rare earth metals than Eu, for which $J \neq 0$, only slightly affects the transition temperature. The effect of Eu on the $\gamma - \alpha$ phase transition temperature in Ce is also accounted for. A second, more general, exchange Hamiltonian is expressed with the aid of second quantization operators for groups of electrons in a form involving coefficients that can be evaluated in any particular case by use of the appropriate fractional parentage and $6j$ coefficients. With the aid of this Hamiltonian one can treat anisotropic effects that arise through participation of the orbital angular momentum of the conduction electron, rather than its spin, in the exchange process. TITLE: Induced reactivity of several compounds with conjugated systems on reacting with 1,1-diphenyl-2-picrylhydrazyl

SOURCE: AN SSSR. Doklady*, v. 154, no. 3, 1964, 627-630

TOPIC TAGS: conjugated polymer, paramagnetic polymer, induced reactivity, hydrogen transfer, pi complex, polymer chemistry, polyphenylene, electron paramagnetic resonance, paramagnetic activation, 1,1-diphenyl-2-picrylhydrazyl, paramagnetic induction of reactivity

ABSTRACT: The reaction of 1,1-diphenyl-2-picrylhydrazyl (DFPH) with solutions of paramagnetic polymers containing conjugated bond systems (polyphenylene (PF), polyazophenylene, polymethylpyridylacetylene, polyphenylacetylene, and heat-treated anthracene) and with anthracene monomer, was studied spectrophotometrically and by the EPR. DFPH is not destroyed in solution with anthracene, which is

Card 1/3

ACCESSION NR: AP4013331

not paramagnetic, but is destroyed on addition of PF; its destruction increases with temperature and is dependent on the presence of oxygen. The destruction is associated with the transfer of H from the conjugated system (not from the solvent) to form 1,1-diphenyl-2-picrylhydrazine, but not a DPPH-PF compound. The following reaction mechanism proposed: DPPH dissolves to form solvated complexes, which on addition of PF form a DPPH(PF)solvent pi-complex. Paramagnetic centers of the PF activate the S-T transition of the diamagnetic PF macromolecule, making possible the transfer of the H to the acceptor DPPH. The active PF radical thus formed breaks off an H (or other atom, e.g. halogen) from the solvent molecule in the complex, and the remaining solvent radical reacts with a second molecule of DPPH (or recombines). This mechanism explains the relatively low effective activation energy, the acceleration of the reaction with increasing conjugated bond polymer concentration, and the presence of two low molecular end products. This induction of reactivity by paramagnetic centers of polymers with conjugated bond systems opens the road to new methods in organic and polymer chemis-

661. Water absorption of melting oxides.—H. Vott, Warptorp (Z. Elektrochem., 55, 445, 1951). It can be shown that some hydrides, e.g. those of Be and Al, are stable above 2,000° C. when dissolved in their metal oxide and, in small quantities, even when in the gaseous state. In view of the ignitability of cpds. hydrides in analytical chemistry, this is of interest. It was observed that rods of Al_2O_3 ; a few mm. thick gave clear melting beads in the oxyhydrogen flame, whereas when melted down rapidly they gave beads which swelled during cooling or spouted. The same result was observed with BeO and La_2O_3 . Apparently the fusion gave off a gas which escaped during freezing. This gas could only be H_2O . The same was observed during melting in a ZrCl_4 tube (heated from outside) when vapour was introduced. The process is explained thus: H_2O absorbed during melting has no place in the crystal lattice and escapes during freezing. This water absorbed by the fusion cannot be water of hydration; it is assumed that there exists a cpd. which withstands 2,000° C.

1.01 Cerium. High Quality Cerium Oxides (Electrolytic Cerium Oxide).—B. Vasil' A. J. Skorikov. *Journal of Phys. (of USSR)*, No. 6, Vol. 8, 1934, p. 384; in English, same issue only, in full in Nat. I. A. Ball, *Encyclopedia of Soils* de l'UNESCO, Serie Physique, tome 1, 1934.

W.E.

summary of materials

1761. CERAMIC HIGH QUALITY CONDENSERS [Temperature Coefficient and Composition of Ceramic Dielectrics].—B. Vasil' & J. Skanavi. (*Journ. of Phys. [of USSR]*). No. 6, Vol. 8, 1944, p. 384; in English, summary only; in full in Nos. 1-4, *Bull. de l'Acad. des Sci. de l'URSS. Série Physique*, 1944.]

1945

Aging of electrical insulating materials. I. Goldman
and B. Veed. *Techn. Physics U.S.S.R.* 1, 42 (1934).
Breakdown of paper, varnished cloth and cellulose acetate is
due to the action of O and N oxides formed by discharge
in air, and is minimized by avoiding air gaps. B. C. A.

ASW-SLA - METALLURGICAL LITERATURE CLASSIFICATION

LEPAJÜE, Jaan; VOOL, K., red.

[Drying, cleaning, and storage of grain] Teravilja
kuivatamine, pul...stamine ja säilitamine. Tallinn, Eesti
Riiklik Kirjastus, 1963. 97 p. [In Estonian]

(MIRA 17:10)

SEPP, Jaan; VOOL, K., red.

[Correspondence between wages and the efficiency of labor
in the agriculture of the Estonian S.S.R.] Töötasu vasavu-
sest töövilkusele Eesti NSV põllumajanduses. Tallinn,
Eesti Riiklik Kirjastus, 1963. 100 p. [In Estonian]
(MIRA 17:6)

VIPPER, Heinrich; VOOL, K., red.; EINBERG, K., tekhn. red.

[Annual lupines] Üheaastased lupiinid. Tallinn, Eesti
Riiklik Kirjastus, 1962. 188 p. (MIRA 16:12)
(Lupines)

TEITEL'BAUM, Viktor; VOOL, K., red.; PEDARI, J., tekhn. red.

[Problems in the development of vegetable growing in the
Estonian S.S.R.] Koogiviljakasvatuse arendamise kusimusi
Eesti NSV-s. Tallinn, Eesti Riiklik Kirjastus, 1961. 32 p.
(MIRA 16:1)

(Estonia—Vegetable gardening)

LEETOJA, Rihard; VOOL, K., red.; LUMET, E., tekhn. red.

[Vegetable growing in greenhouses] Koogivilja kasvatamine kat-mikalal. Tallinn, Eesti riiklik kirjastus, 1961. 383 p.
(MIRA 15:5)

(Estonia—Vegetable gardening)
(Greenhouse management)

VESKI, Vello; NIINE, Aleksander; VOOL, K., red.; SEPP, A., tekhn. red.

[Decorative trees and shrubs] Ilupuud ja -poosad. Tallinn,
Eesti riiklik kirjastus, 1961. 359 p. (MIRA 15:5)
(Plants, Ornamental)

PEDAJA, Valter; VCOL, K., red.; KOHU, H., tekhn. red.

[Rhubarb growing] Rabarberikasvatus. Tallinn, Eesti riiklik
kirjastus, 1961. 15 p. (MIRA 15:5)
(Estonia--Rhubarb)

MARTINSOO, L.; VOOL, K., red.; SUURVARAV, A., tekhn.red.

[Work experience of the Vinni State Demonstration Farm]
Vinni näidissovhoosi töökogemusi. Tallinn, Eesti Riiklik
Kirjastus, 1963. 42 p. (MIRA 17:1)

KIIK, H.; VOOL, K., red.; TÜNISSON, A., tekhn. red.

[New and advanced farming methods] Uut ja eesrindlikku
põllumajanduses. Tallinn, Eesti Riiklik Kirjastus, 1963.
(MIRA 17:1)

(Farm management)

RAUD, A.; VAHER, A.; VOOL, K., red.; SEPP, A., tekhn. red.

[Catalog of types of regionalized and promising agricultural crops of the Estonian S.S.R.] Eesti NSV-s rajoontatud ja perspektiivsete põllumajanduskultuuride sortide Kataloog.
Tallinn, Eesti Riiklik Kirjastus, 1960. 25 p. (MIRA 15:1)
(Estonia—Field crops)
